0,6 x 0,25 m

Loads for tactical inflatable bunkers

Dimensions:

0,6 x 0,125 m

Water bladder in inflatable Bunkers is a special isolated compartment, which is located in the lower part inside the bunker. This compartment is intended for filling bunkers with water and installing them on the field without additional fastenings (sandbags, pegs, etc.)

Bunkers with a water filled compartment do not require additional fixation at the site and have the "roly-poly" effect when they fall. That is, when a player collides with a bunker on the field, it always remains in its place due to the weight of water that makes it immobile (the weight of the water filled compartment is from 50 to 100 kg). And when the bunker falls on its side, due to the pressure of water in the isolated compartment inside, the bunker returns to its original position (see Video review).

In the bunkers of the Pro series, the valve for filling with water is under the bunker.

**IMPORTANT!**

Bunkers of the Pro series can be operated with or without a water-filled compartment. The bunker is simply pumped with air and placed on the field. In all the bunkers of the Pro series, there is also a rail for fastening the bunkers on the field with the help of loads, pegs, etc.

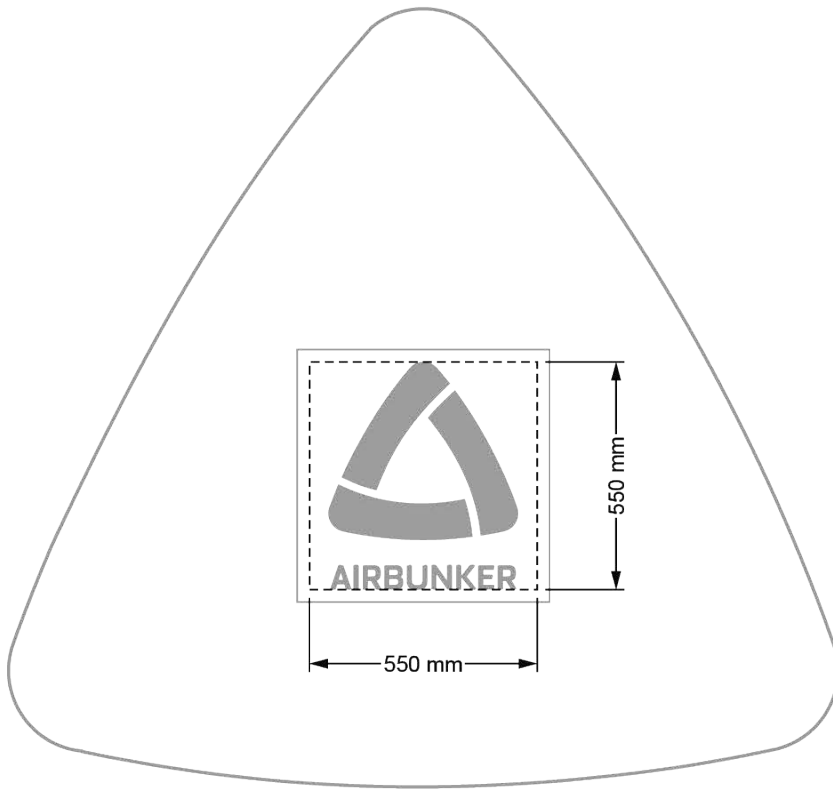

The fastening system with water filling reliably fixes inflatable bunkers and ensures their stable position. Installation of products does not require special knowledge and tools. Compartments of water bladders are filled with water, according to the instruction.

NEW

Branding

Drawing your logo on the bunker on order

The cost of a logo [for the design of a bunker]

- From 10 pieces
€ **10 for one logo**

Layout requirements [for the design of a bunker]

- Accepted formats: cdr, ai, eps, svg
